

# Electronics Systems (938II)

Lecture 4.1

Programmable Logic Devices – Principles and PAL

#### Introduction

- PLD = Programmable Logic Device
  - Programming HW, not SW!
  - Configurable logic elements that can implement different circuits
    - Configuration #1
- → circuit/logic function #1
- Configuration #2 →
  - → circuit/logic function #2

- •
- Not different pieces of HW, but the same piece of HW used in different ways!

#### Introduction

#### • PLD

- We have already seen some examples of programmable connections
  - Fuses/anti-fuses
  - MOS transistors
  - **...**
- And how to program logic functions?

Any combinational logic function can be represented by a Boolean expression

#### Operators

```
+ \rightarrow OR (gate)
```

$$\rightarrow$$
 AND (gate)

$$\bullet$$
 NOT (gate)

#### Forms

- Sum-of-Products (SP)
- Product-of-Sums (PS)

- Any combinational logic function can be represented by a Boolean expression
  - Operators

```
\bullet + \rightarrow OR (gate)
```

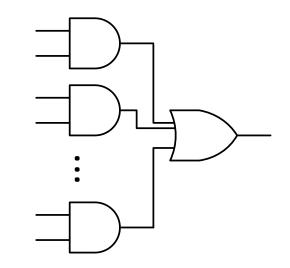

- $\bullet$  ·  $\rightarrow$  AND (gate)
- $\bullet$  NOT (gate)
- Forms
  - Sum-of-Products (SP) → AND gates feeding an OR gate
  - Product-of-Sums (PS)

- Any combinational logic function can be represented by a Boolean expression
  - Operators
    - OR (gate)
    - AND (gate)
    - NOT (gate)
  - Forms
    - Sum-of-Products (SP) →

AND gates feeding an OR gate

Product-of-Sums (PS)

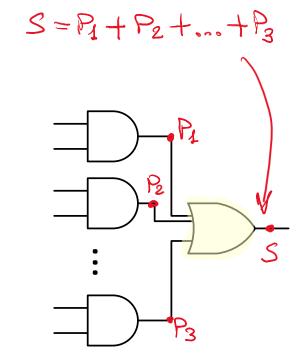

- Any combinational logic function can be represented by a Boolean expression
  - Operators
    - OR (gate)
    - AND (gate)
    - NOT (gate)
  - Forms
    - Sum-of-Products (SP)

Product-of-Sums (PS)

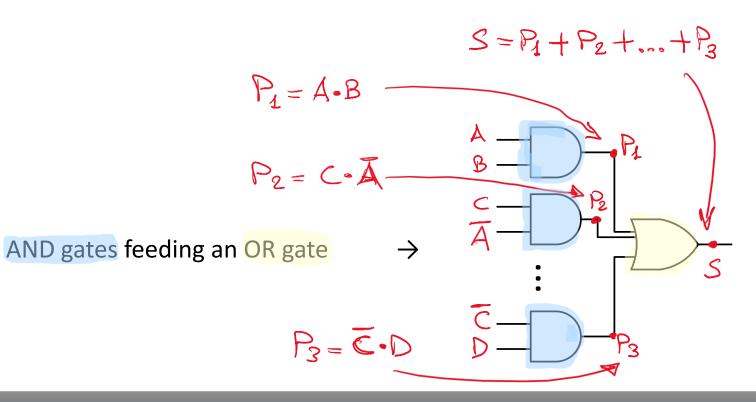

AND gates feeding an OR gate

Any combinational logic function can be represented by a Boolean expression

- Operators
  - $\bullet$  +  $\rightarrow$  OR (gate)
  - $\cdot$  AND (gate)
  - $\bullet$   $\rightarrow$  NOT (gate)
- Forms
  - Sum-of-Products (SP) →
  - Product-of-Sums (PS)

- Any combinational logic function can be represented by a Boolean expression
  - Operators

```
\bullet + \rightarrow OR (gate)
```

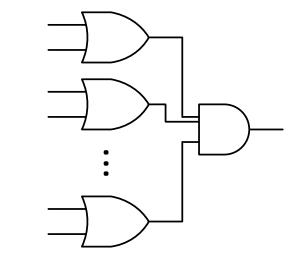

• 
$$\cdot$$
 AND (gate)

- $\bullet$  NOT (gate)
- Forms
  - Sum-of-Products (SP)
  - Product-of-Sums (PS) → OR gates feeding an AND gate

- Any combinational logic function can be represented by a Boolean expression
  - Operators
    - $\bullet$  +  $\rightarrow$  OR (gate)
    - $\bullet$  ·  $\rightarrow$  AND (gate)
    - $\bullet$  NOT (gate)
  - Forms
    - Sum-of-Products (SP)
    - Product-of-Sums (PS) →

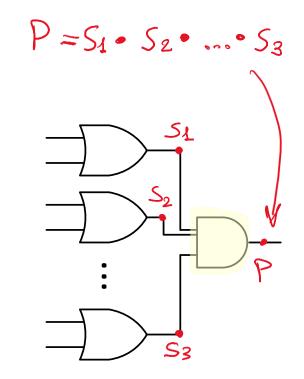

OR gates feeding an AND gate

- Any combinational logic function can be represented by a Boolean expression
  - Operators
    - $\blacksquare$  +  $\rightarrow$  OR (gate)
    - $\bullet$  ·  $\rightarrow$  AND (gate)
    - $\bullet$  NOT (gate)
  - Forms
    - Sum-of-Products (SP)
    - Product-of-Sums (PS) →

OR gates feeding an AND gate

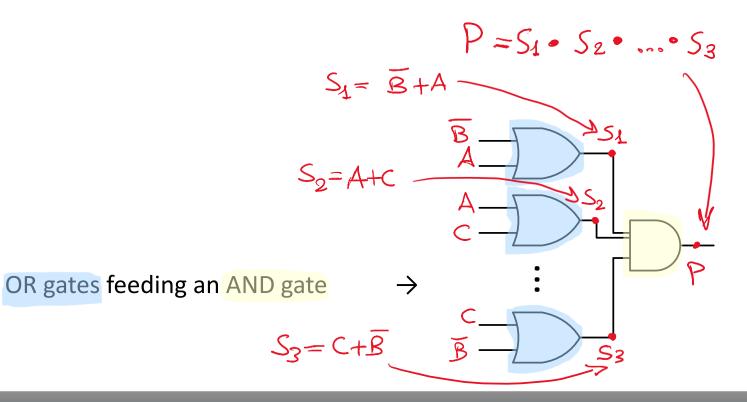

Any combinational logic function can be represented by a Boolean expression

- Operators
  - $\bullet$  +  $\rightarrow$  OR (gate)

  - $\blacksquare$   $\rightarrow$  NOT (gate)
- Forms
  - Sum-of-Products (SP)
  - Product-of-Sums (PS) →

- Example(s)
  - Karnaugh map (KM or K-map) = graphical method to express logic functions as SP or PS

- Example(s)
  - Karnaugh map (KM or K-map) = graphical method to express logic functions as SP or PS
    - Showing SP case Usually associated to active high

- Example(s)
  - Karnaugh map (KM or K-map) = graphical method to express logic functions as SP or PS
    - Showing SP case
  - Example #1
    - $f_1(a,b) = a \cdot b$
    - AND gate/function

- Example(s)
  - Karnaugh map (KM or K-map) = graphical method to express logic functions as SP or PS

How to

- 1. Find all the largest group(s) of contiguous 1s
- 2. For each group, select only the inputs whose value does not change
- 3. Complement surviving inputs whose value is 0
- 4. Multiply the surviving inputs  $\rightarrow$  products  $P_i$
- 5. Sum the products

- Example(s)
  - Karnaugh map (KM or K-map) = graphical method to express logic functions as SP or PS

Showing SP case

• Example #5

•  $f_5(a,b) = ??$ 

Truth table

• KM \_\_\_\_\_

а	b	С	у	
0	0	0	0	• F
0	0	1	1	bc
0	1	0	0	00 01 11 10
0	1	1	1	0 0 1 1 0
1	0	0	0	<u>a</u> 1 0 0 1 0
1	0	1	0	1
1	1	0	0	
1	1	1	1	

How to

- 1. Find all the largest group(s) of contiguous 1s
- 2. For each group, select only the inputs whose value does not change
- 3. Complement surviving inputs whose value is 0

    - However, the goal is not to learn how to use Karnaugh maps, but ...
- ... demonstrating that

# any logic function can be implemented as a network of AND and OR (and NOT) gates!

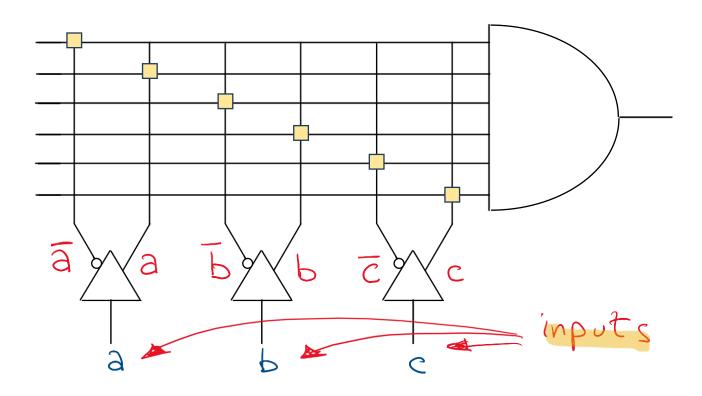

- Earliest PLDs were called Programmable Array Logic (PAL)
  - Programmable network of OR, AND, and NOT gates
    - Pre-defined network
    - Programmable connections among gates
  - PROM to program (and re-program) connections

- Programmable connection(s)
  - Connecting input to AND gate
  - Determining the type of PAL/PLD
    - OTP = One-Time Programmable
      - Fuse/Anti-fuse
    - Reprogrammable
      - UV-EPROM style (FAMOS)
      - Flash memory style (Flash transistor)

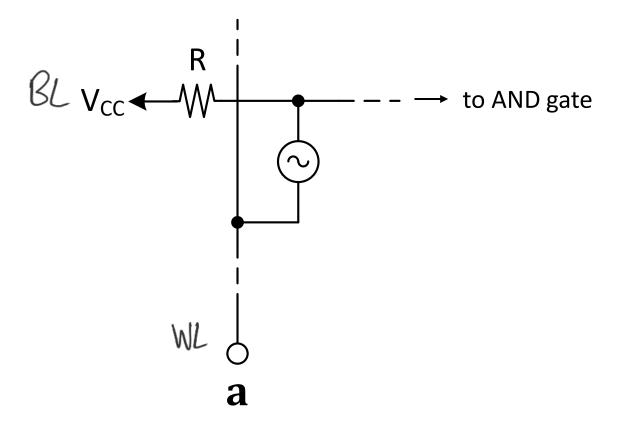

- Programmable connection(s)
  - Connecting input to AND gate
  - Determining the type of PAL/PLD
    - **OTP** = **O**ne-**T**ime **P**rogrammable
      - Fuse/Anti-fuse
    - Reprogrammable
      - UV-EPROM style (FAMOS)
      - Flash memory style (Flash transistor)

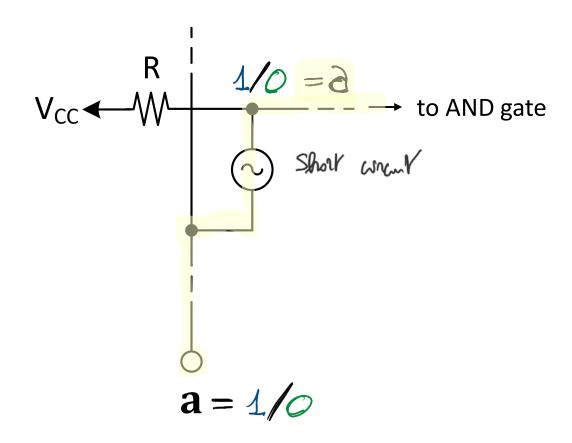

- OTP PAL
  - Fuse

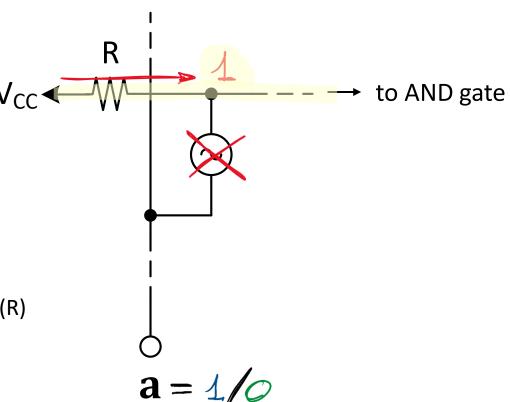

- OTP PAL
  - Fuse
    - Default (Fuse not vaporized)
      - Input pin (a) connected to the AND gate

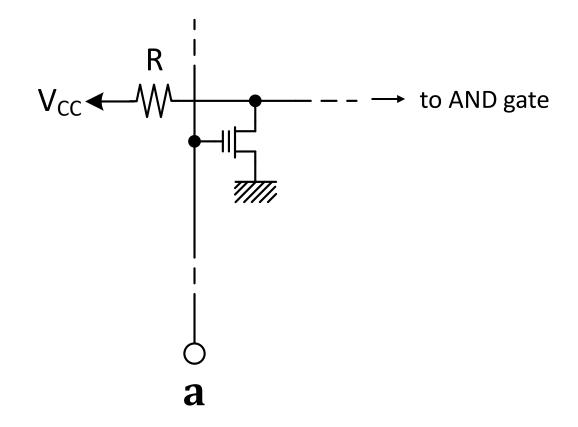

- OTP PAL
  - Fuse
    - Default (Fuse not vaporized)
      - Input pin (a) connected to the AND gate
    - Fuse vaporized (after programming)
      - Link to the input pin broken
      - AND gate input connected only to the pull-up resistor (R)
        - Always logic 1
        - Not altering the AND gate functionality!!!

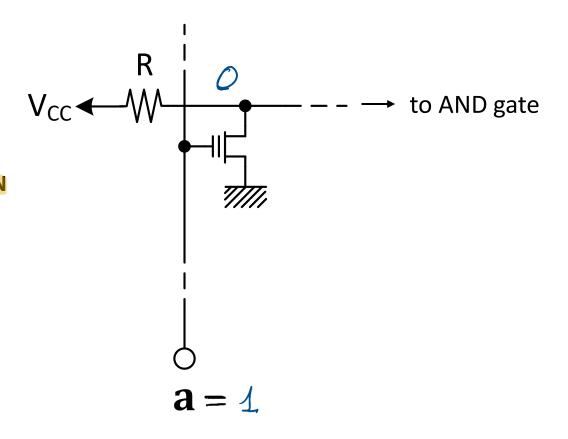

- Reprogrammable PAL
  - UV erasable (FAMOS)

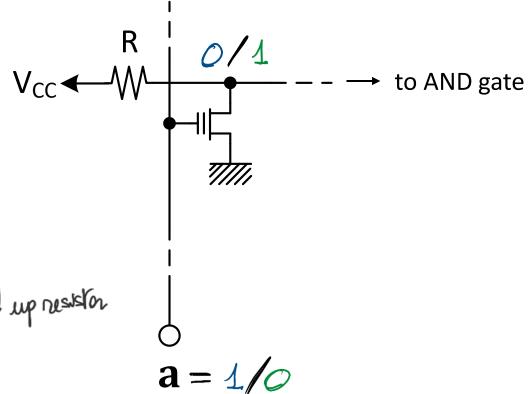

- Reprogrammable PAL
  - UV erasable (FAMOS)
    - Default (FAMOS not programmed)
      - If input pin (a) = logic 1 ( $V_{CC} > V_T$ ) → transistor **ON** 
        - AND gate input = logic 0

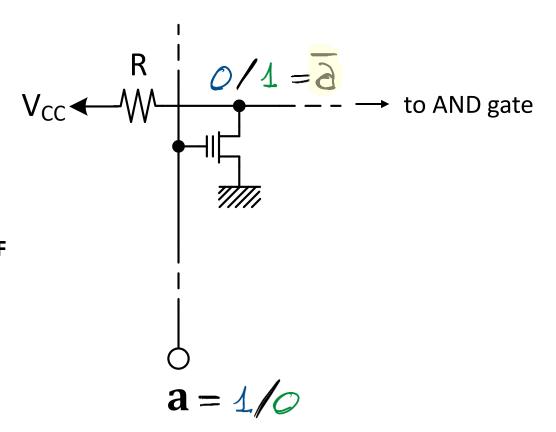

- Reprogrammable PAL
  - UV erasable (FAMOS)
    - Default (FAMOS not programmed)
      - If input pin (a) = logic 1 ( $V_{CC} > V_T$ ) → transistor **ON** 
        - AND gate input = logic 0
      - If input pin (a) = logic 1 (0  $V < V_T$ ) → transistor OFF
        - AND gate input = logic 1

Because of the pull up resistor

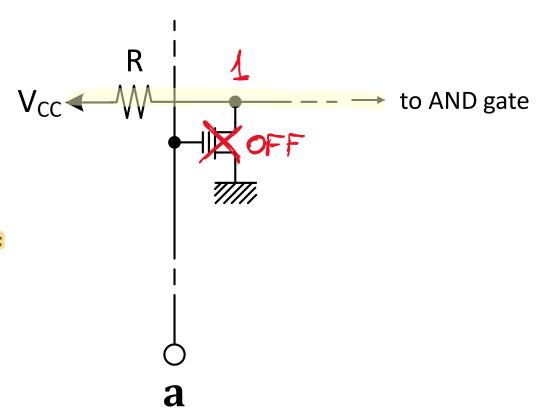

- Reprogrammable PAL
  - UV erasable (FAMOS)
    - Default (FAMOS not programmed)
      - If input pin (a) = logic 1 ( $V_{CC} > V_T$ ) → transistor **ON** 
        - AND gate input = logic 0
      - If input pin (a) = logic 1 (0  $V < V_T$ ) → transistor **OFF** 
        - AND gate input = logic 1
      - Attention! Inverting logic / active-low logic!!!

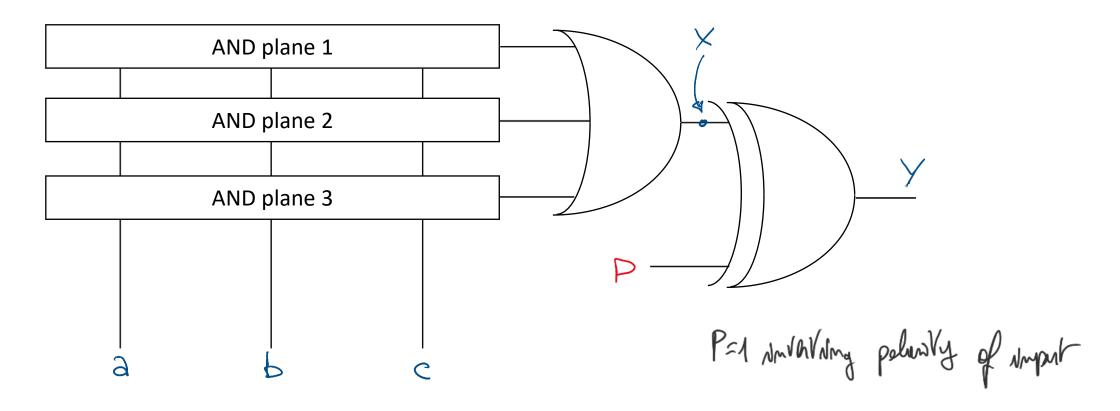

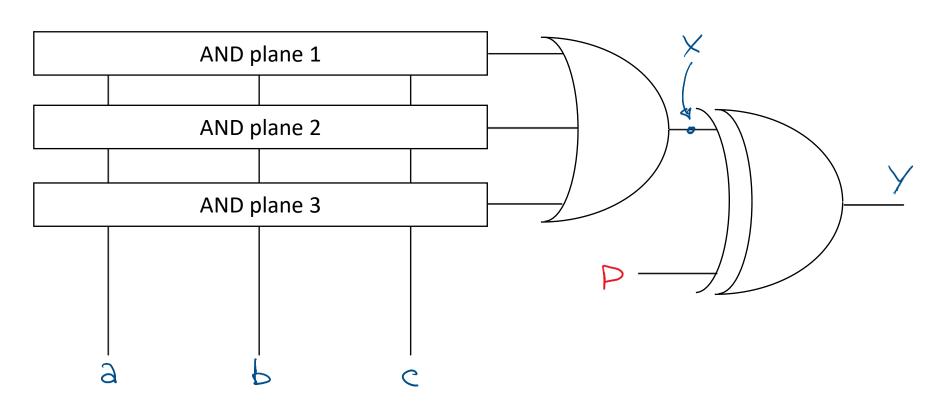

- Reprogrammable PAL
  - UV erasable (FAMOS)
    - Default (FAMOS not programmed)
      - If input pin (a) = logic 1 ( $V_{CC} > V_T$ ) → transistor **ON** 
        - AND gate input = logic 0
      - If input pin (a) = logic 1 (0  $V < V_T$ ) → transistor **OFF** 
        - AND gate input = logic 1
      - Attention! Inverting logic / active-low logic!!!
    - FAMOS programmed  $(V'_T > V_{CC})$ 
      - Transistor always OFF
      - AND gate input always logic 1 (through pull-up resistor to  $V_{CC}$ )
        - Not altering AND gate functionality!!!

 Registered output for sequential logic Introduce sepurated AND plane 1 1DFF AND plane 2 Output Q AND plane 3 Inputs

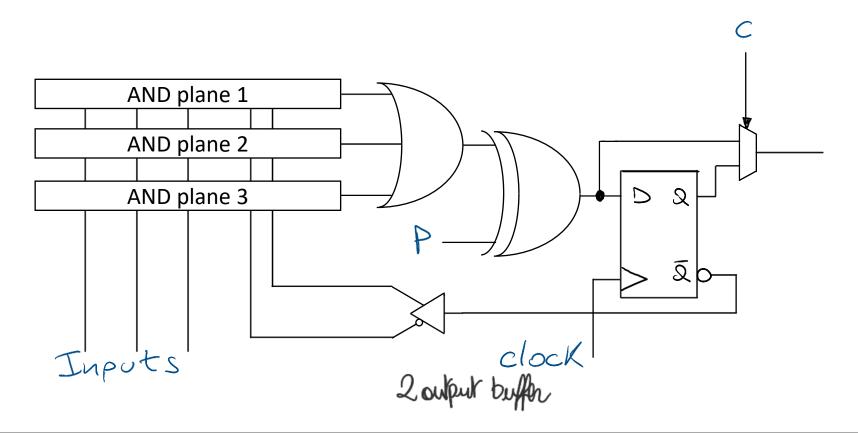

Feedback path for FSM implementation

Filmite state machine: reyster for the state

MUX to select between combinational or sequential output

- PAL has evolved by enriching its functionality/flexibility
   Sometimes also and technic us lech moved forward
- Evolution to more complex PLDs (CPLDs) to the latest and most powerful configurable device
  - FPGA = Field-Programmable Gate Array

How PALs were programmed

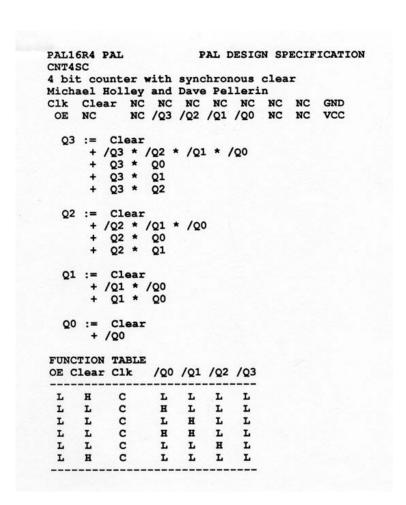

```
• Dedicated equipment

Now you can program than with USB
```

- Programming language
  - PALASM (PAL Assembler)
  - CUPL (Compiler for Universal Programmable Logic)
  - ABEL (Advanced Boolean Expression Language)

- How PALs were programmed
  - Dedicated equipment
  - Programming language
    - PALASM (PAL Assembler)
    - CUPL (Compiler for Universal Programmable Logic)
